

European Flood Awareness System

17th EFAS annual meeting (hybrid)

27-28 September 2022

Emergency

Copernicus Emergency Management Service

Development of National Flood Forecasting and Early Warning System in Georgia

Department of Hydrometeorology

National Environmental Agency

Presenter: Ioseb Kinkladze

27 September 2022

National Environmental Agency

THE AGENCY IS LEGAL SUCCESSOR OF THE NATIONAL METEOROLOGICAL AND HYDROLOGICAL SERVICE OF GEORGIA WHICH WAS FOUNDED IN 1884

NEA WAS ESTABLISHED AS LEGAL ENTITY OF PUBLIC LAW IN 2008

Meteorological and Hydrological Observation

Data collection and dissemination at national and international level

Historical data management and statistical analysis

Weather and hydrological modelling

Weather and hydrological short, medium and long term forecasting

Forecasting and warning dissemination

History of hydrometeorological observation

1832 – fragmented observation started;

1844 – established Tbilisi magnetic-meteorological (geophysical) observatory

1850 – Glaciological expeditions;

1883 – Agrometeorological observation;

1904 – actinometric observation;

1905 – hydrological observation;

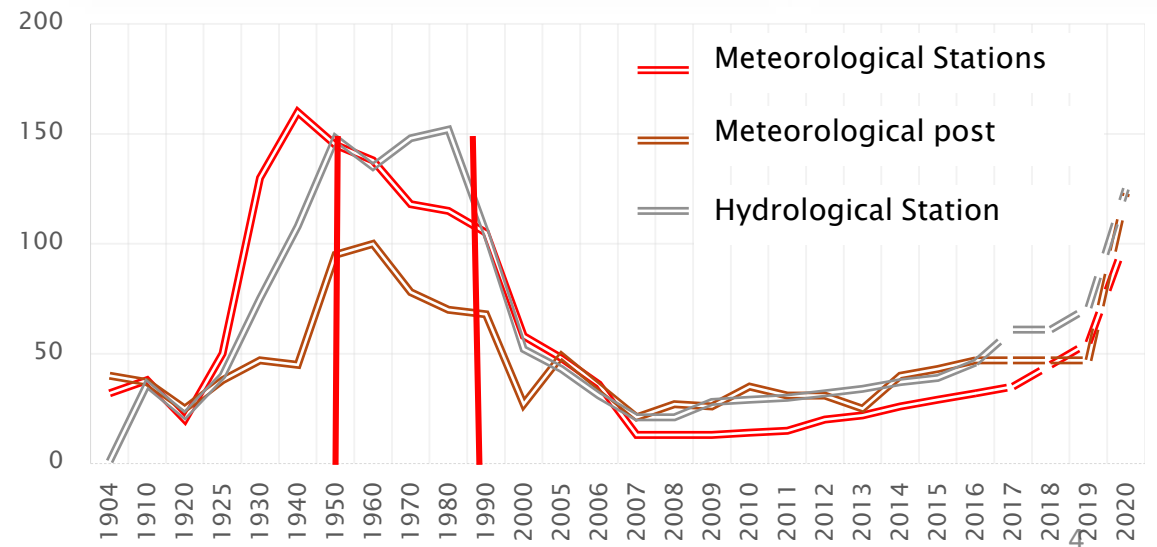

1932 – Snow depth observation by field expeditions;

1937 – air soundings;

1964 – Black Sea water level and meteorological observations;

1967 – Cloud seeding;

1988 – Snow avalanche artificial triggering

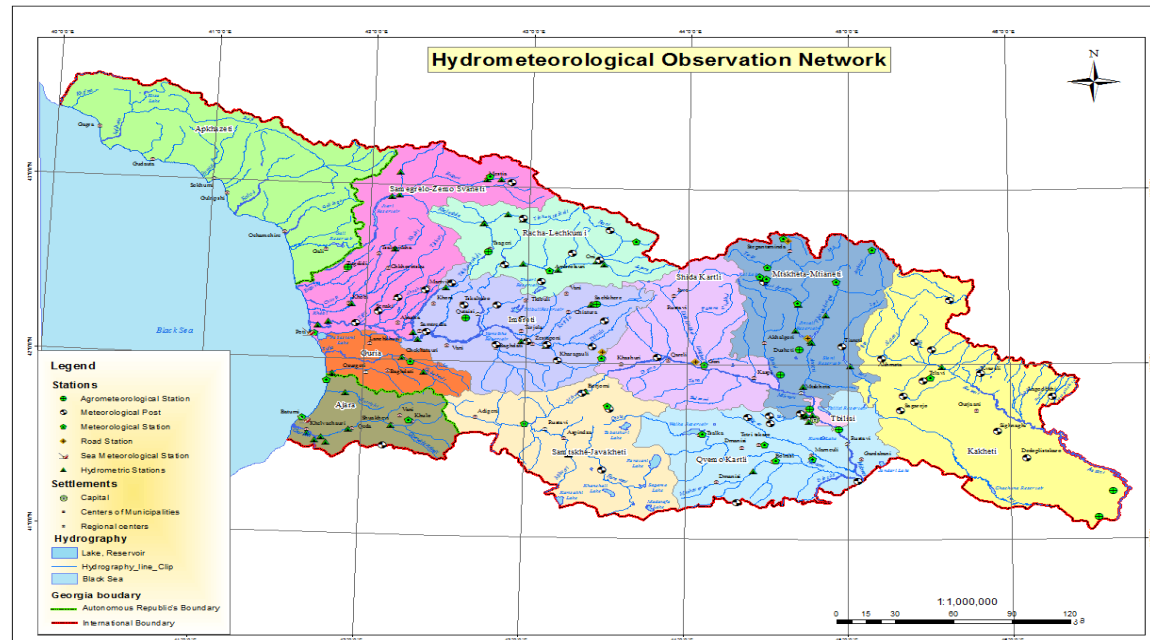

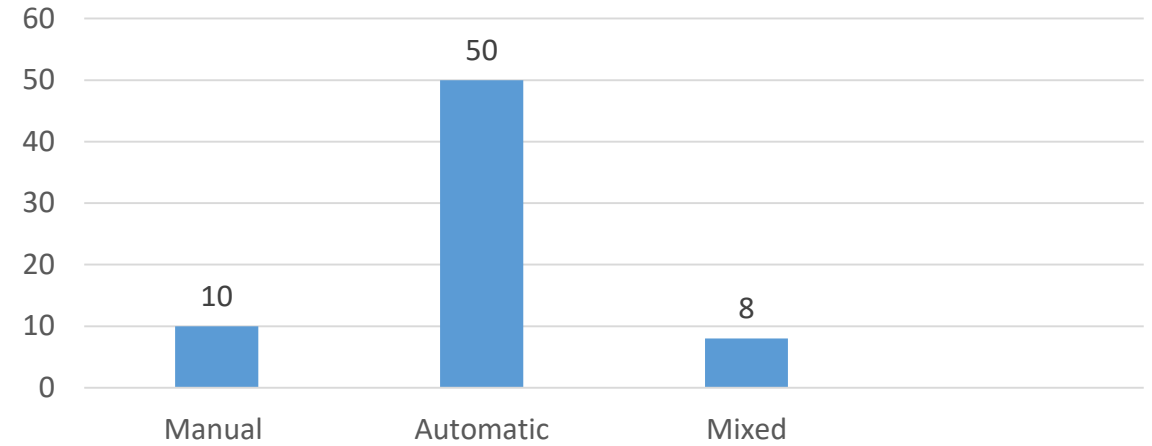

Existing Hydrometeorological Observation Network

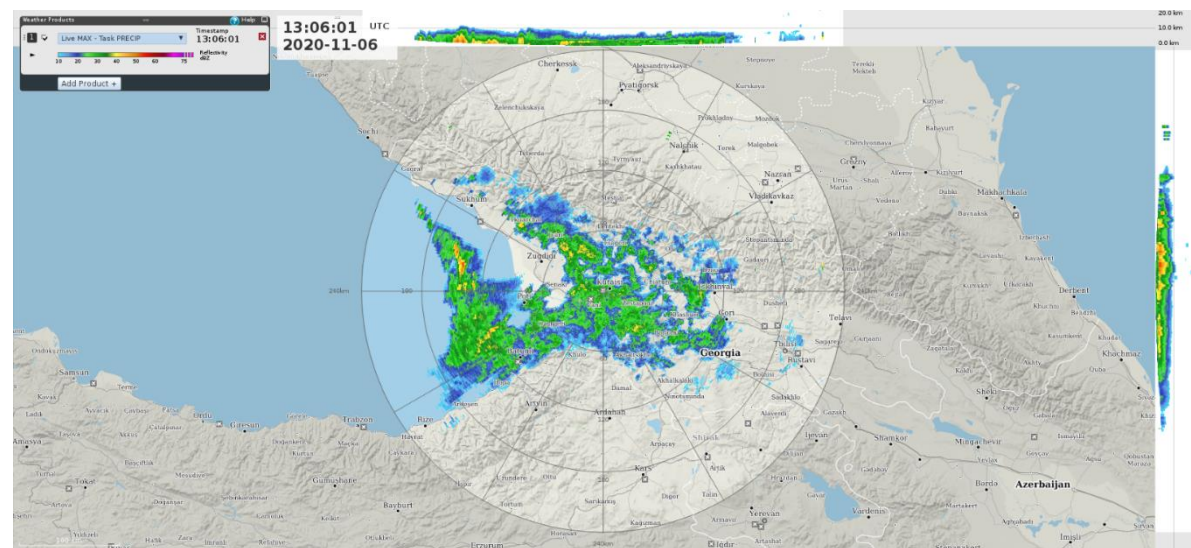

Meteorological Observation Network - 96

Hydrological Observation Network - 68

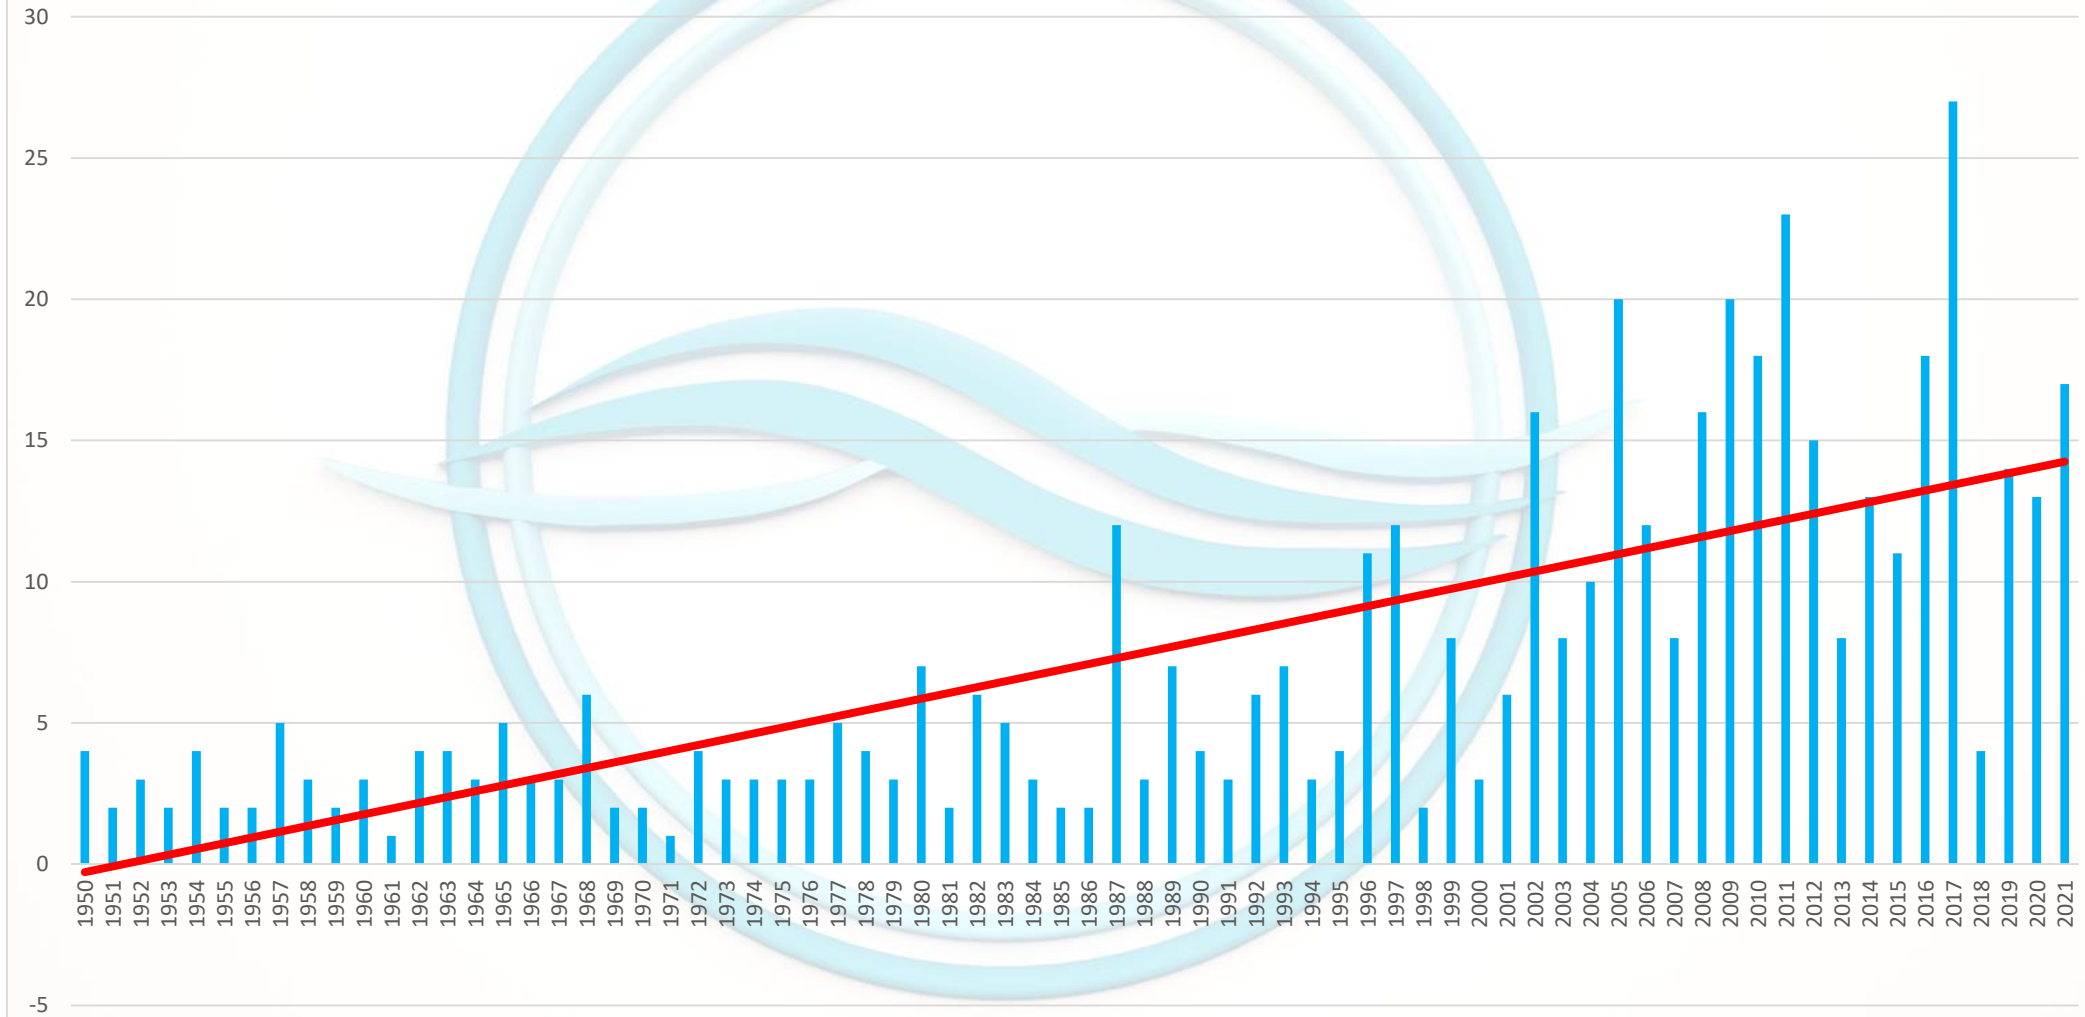

Weather Radar Network

Recorded Floods - 1950-2021

Weather and Climate Related Disasters in Georgia

***Tbilisi flooding - 2015 year
Casualties - 24***

***Debris Flow on national highway - 2011 year
Casualties - 6***

***Glacier Collapse/Debris Flow – military road - 2014 year
Casualties - 6***

***Glacial Lake Outburst Flood (GLOF), Chuberi community – 8
2018 year***

Schweizerische Eidgenossenschaft
Confédération suisse
Confederazione Svizzera
Confederaziun svizra

Reducing the risk of climate-driven disasters

7 Hazards

Flood, Snow Avalanche, Drought, Windstorm, Hailstorm, Landslide, Debris Flow/Mudflow

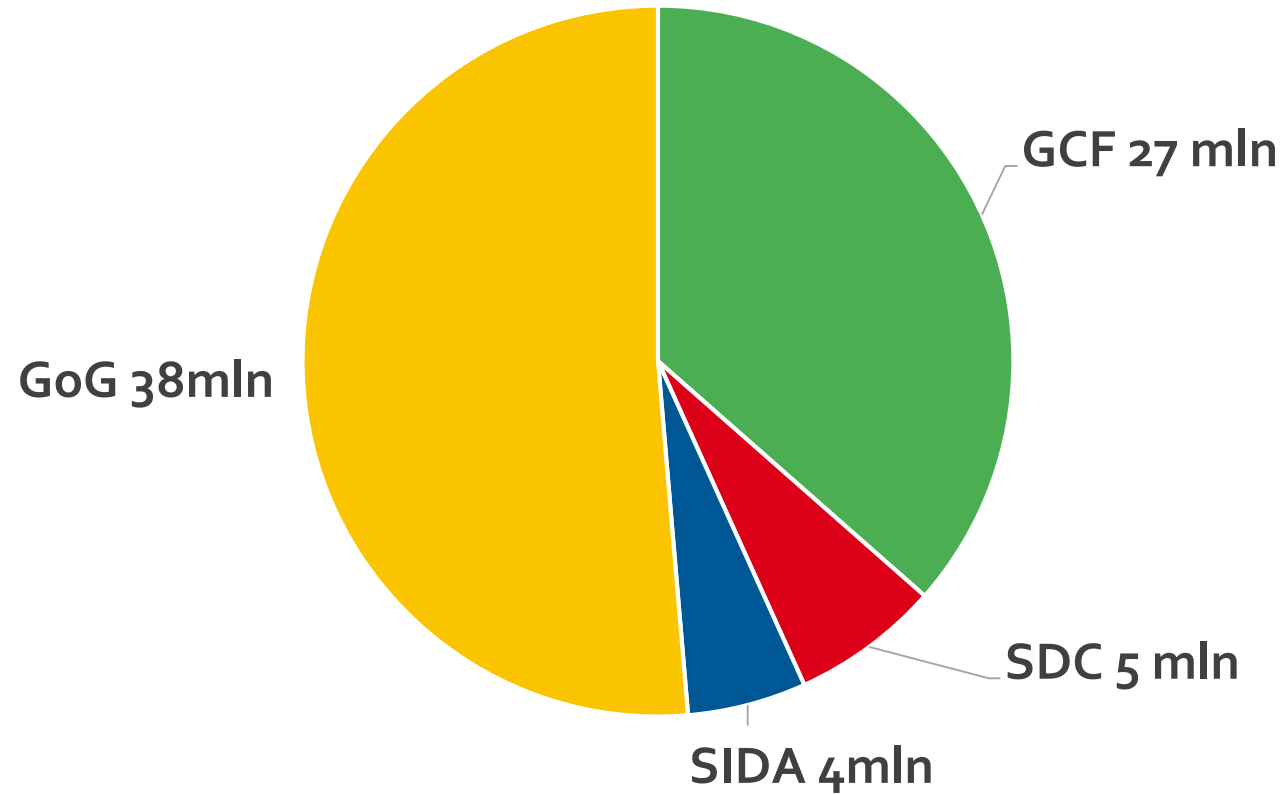

Program Factsheet

7 years

Total budget: 74 Million

Key Activities

- ~ 150 Hydrometeorological Stations (2021-2023)
- High Performance Computing System (2021)
- Financial support to become a co-operating state ECMWF (2021)
- Upgrade of ICT systems (2021-2023)
- 2 Air Sounding Systems (2023-2024)

ECMWF welcomes Georgia as its 12th Co-operating State

1 December 2021

FLOOD HAZARD

Methodologies and procedures for hydrological analysis for the purpose of flood hazard mapping data analysis for Georgia

Methodology for **Flood Hazard** modelling and mapping for Georgia (hydraulic modelling)

2022

Hydrological Modelling
HEC-HMS

Hydraulic Modelling
HEC-RAS 2D

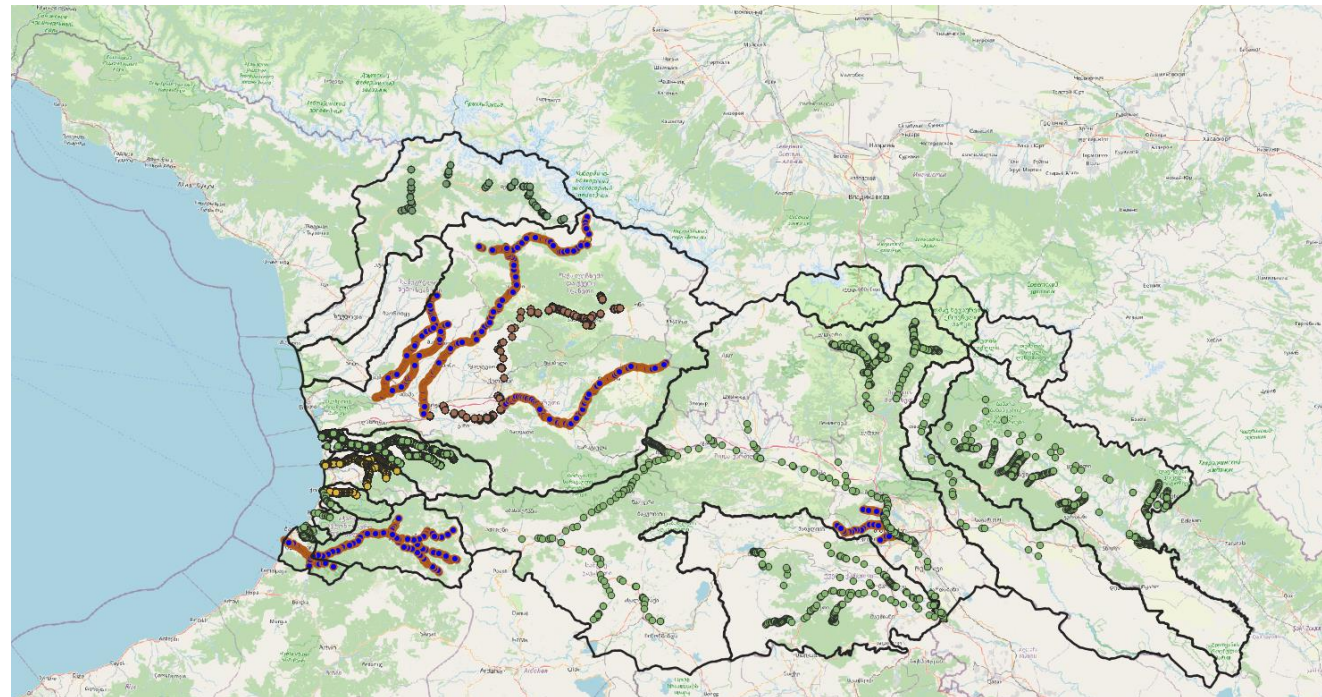

GIS Mapping

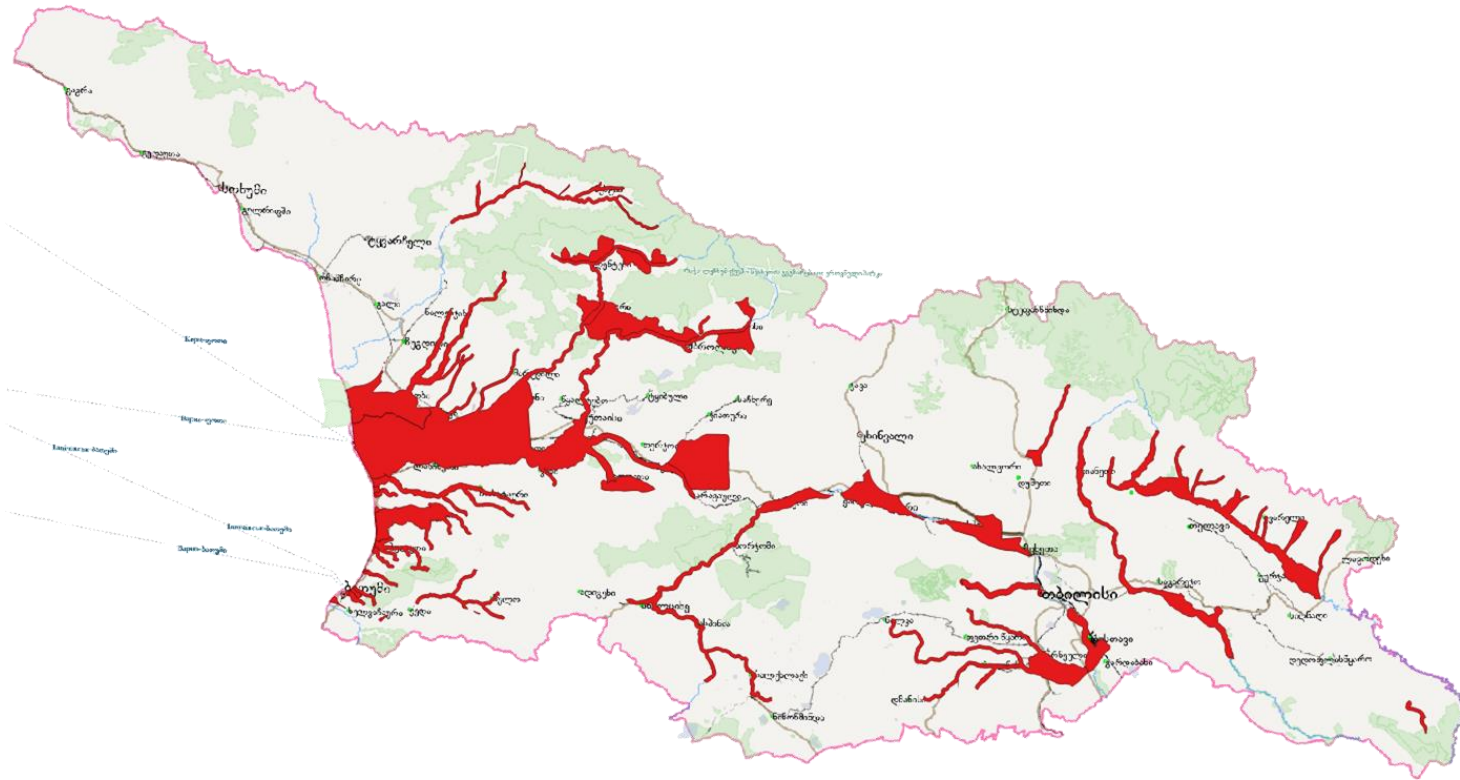

Bathymetric Survey

- Bathymetric survey has been conducted for the entire country

LiDAR Data Collection

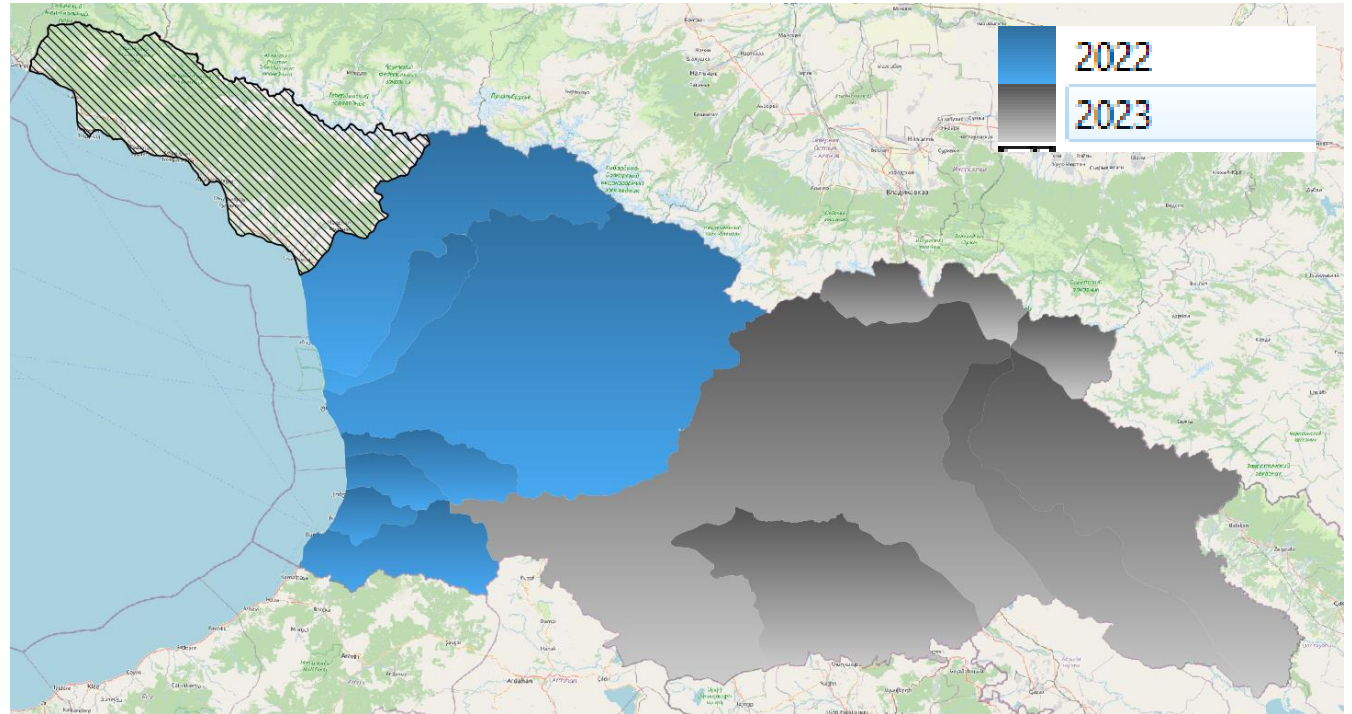

- Survey period: 2020-2021
- Coverage: 6400 km²
- Point cloud : 12 points per 1m²
- DEM Resolution: - 1m

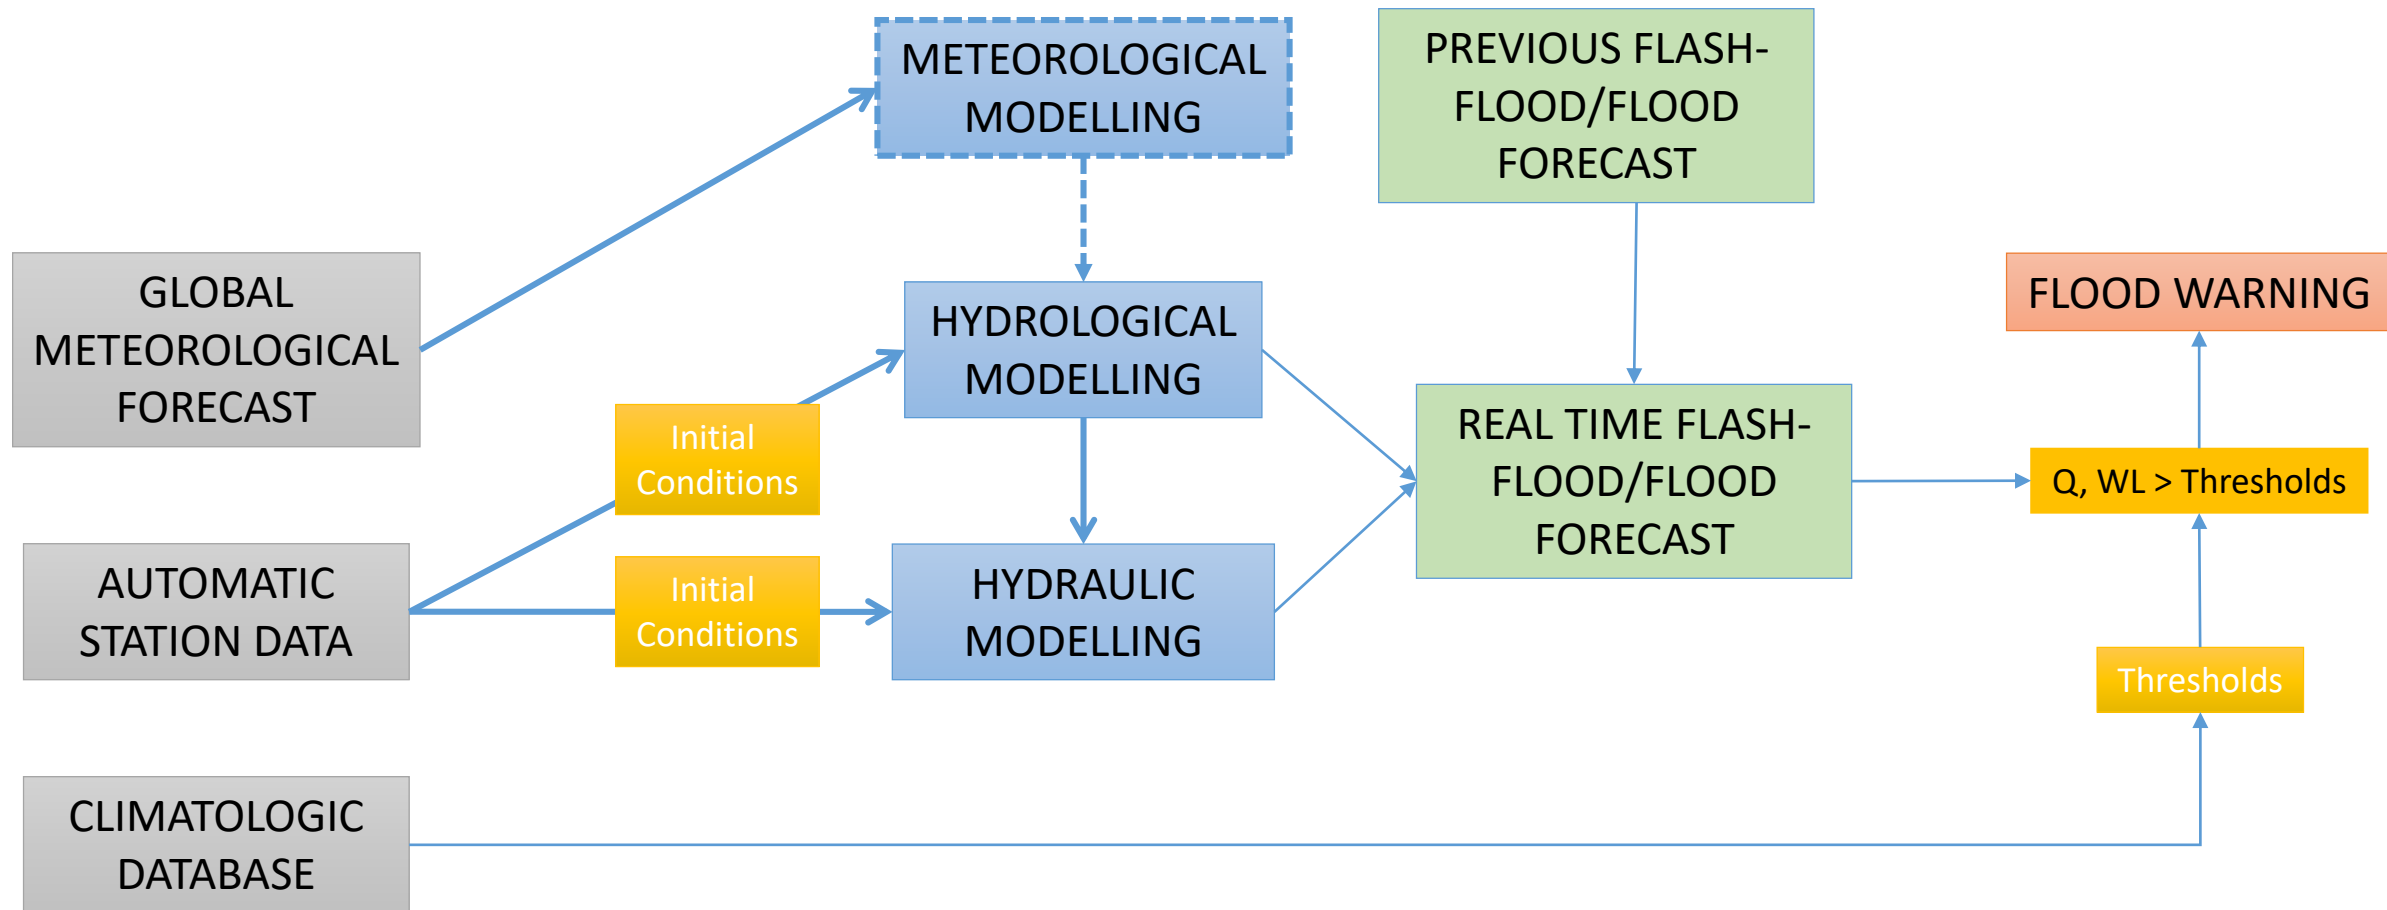

- Return periods
 - 2, 5, 25, 50, 100, 500 years
- Maps
 - Inundation
 - Depth
 - SWE
 - Velocity
 - Time of arrival
 - Flood Duration

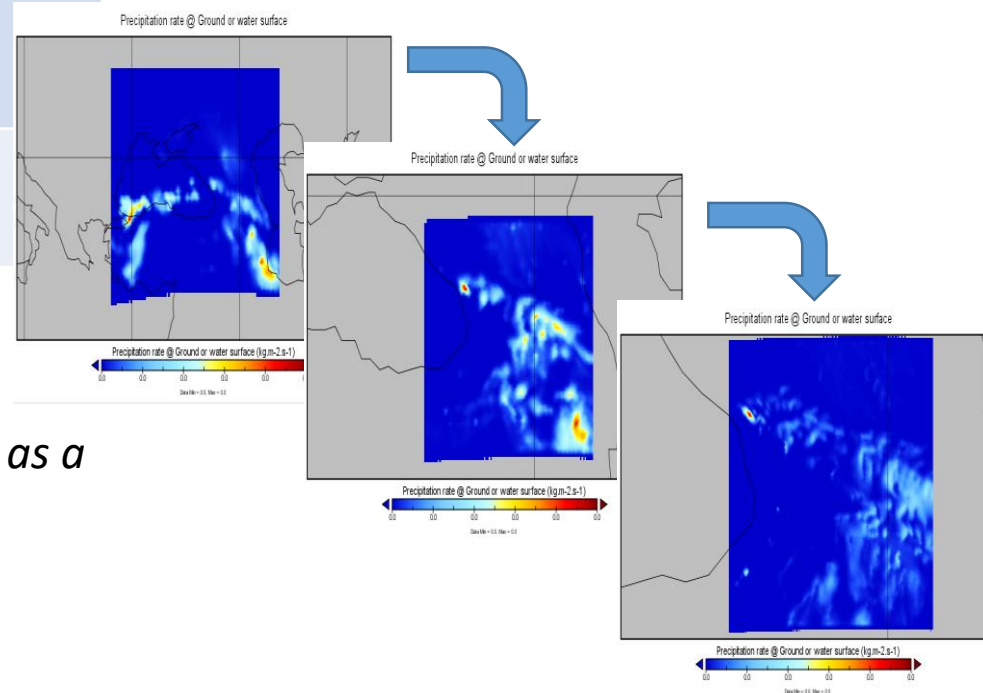

Flood Forecasting - FFEWS approach

| Limited Area Model | Horizontal Resolution (km) | Global NWP/Boundary Conditions | Forecasting time | Runs per day |
|--------------------|----------------------------|--------------------------------|------------------|--------------|
| WRF | ~3 | GFS | 0-4 days | 2 |
| Cosmo | ~7 | ICON | 0-4 days | 2 |

Plans for the next few years

- Use of ECWMF product Atmospheric Model high resolution (HRES) as a boundary condition is under development
- Assimilation of Radar and surface observations
- Development of kilometre-Scale NWP system
- Precipitation nowcasting by radar tracking

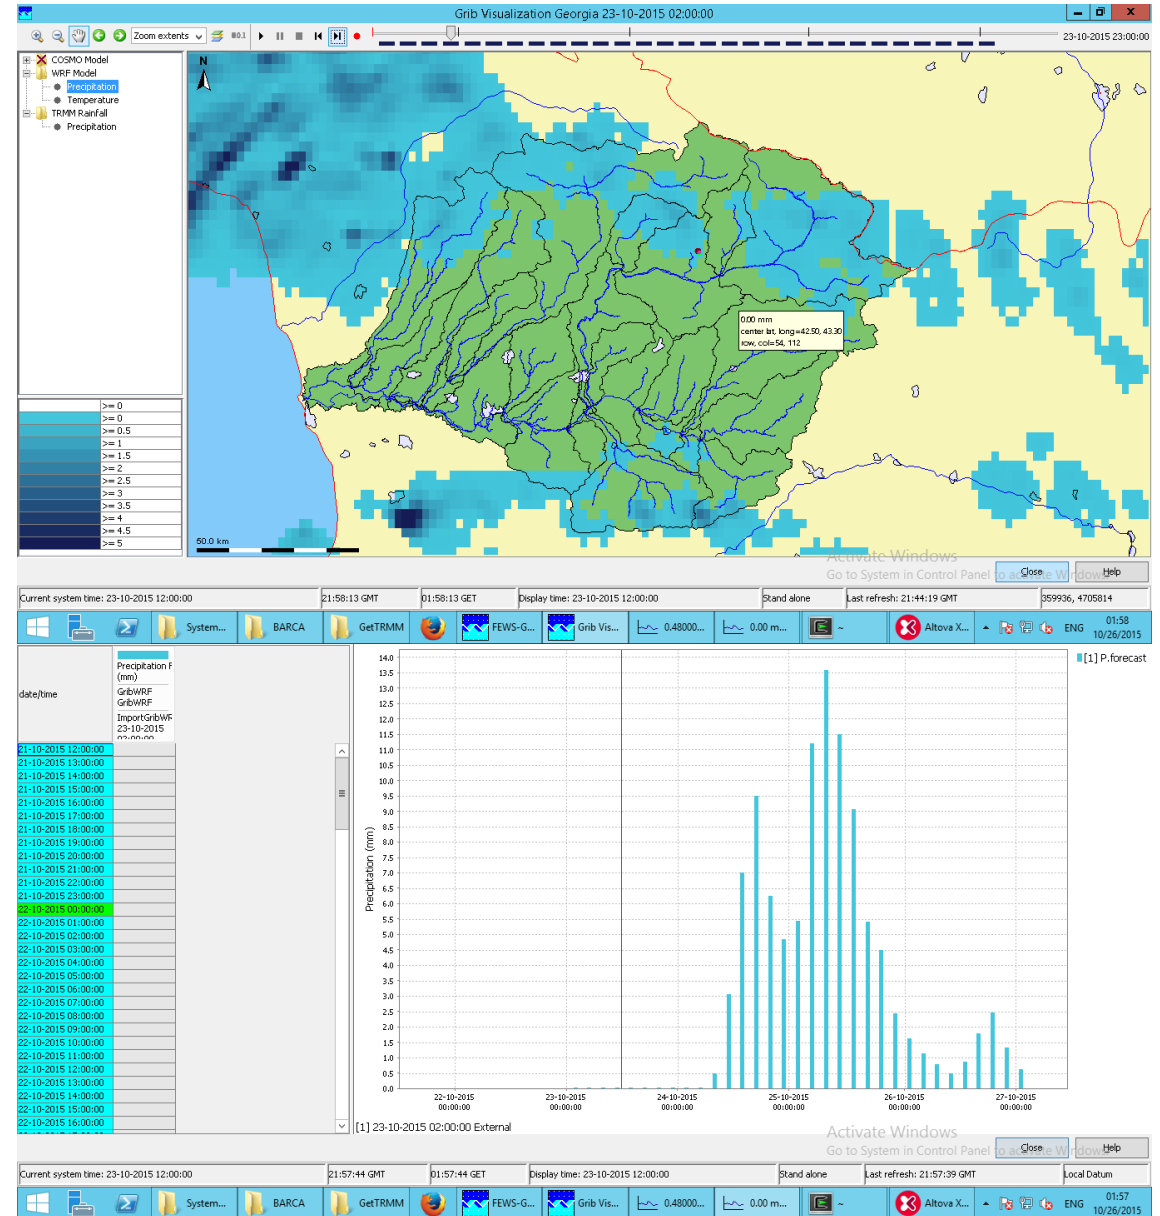

Meteorological Forecast

There are two different regional NWP models implemented by NEA.

- WRF
- COSMO

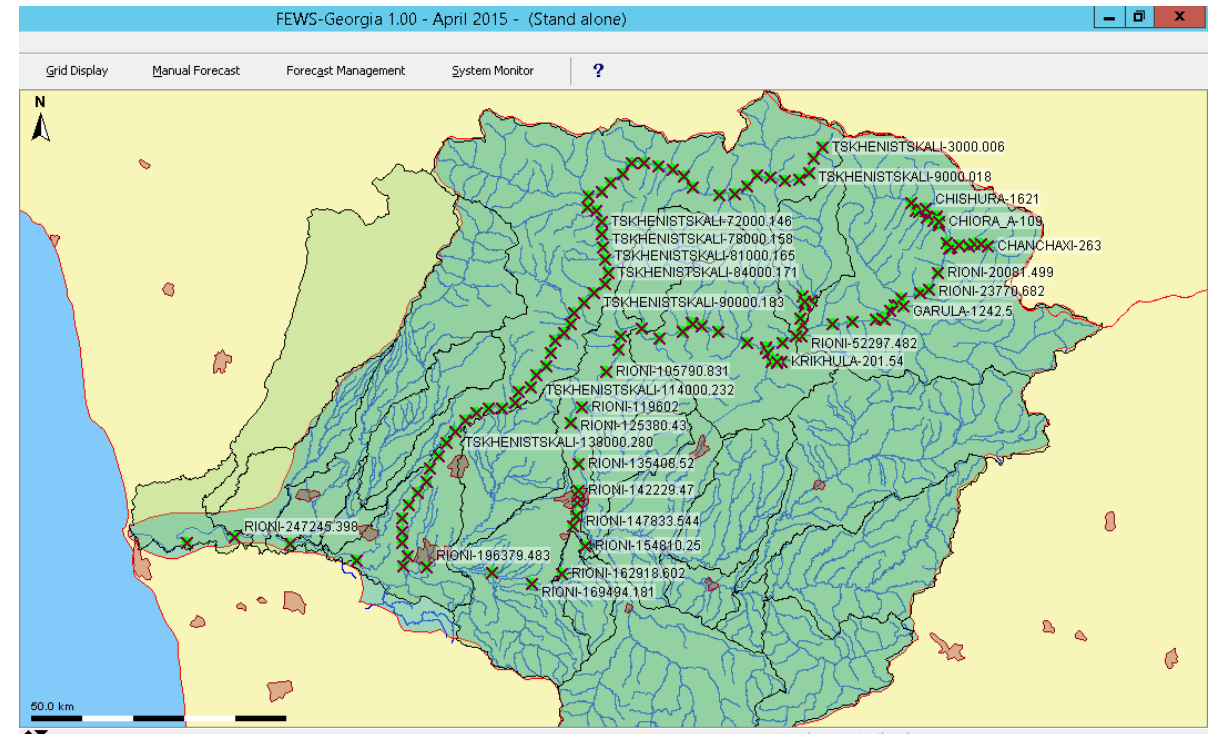

The COSMO model has not been operational in the system currently.

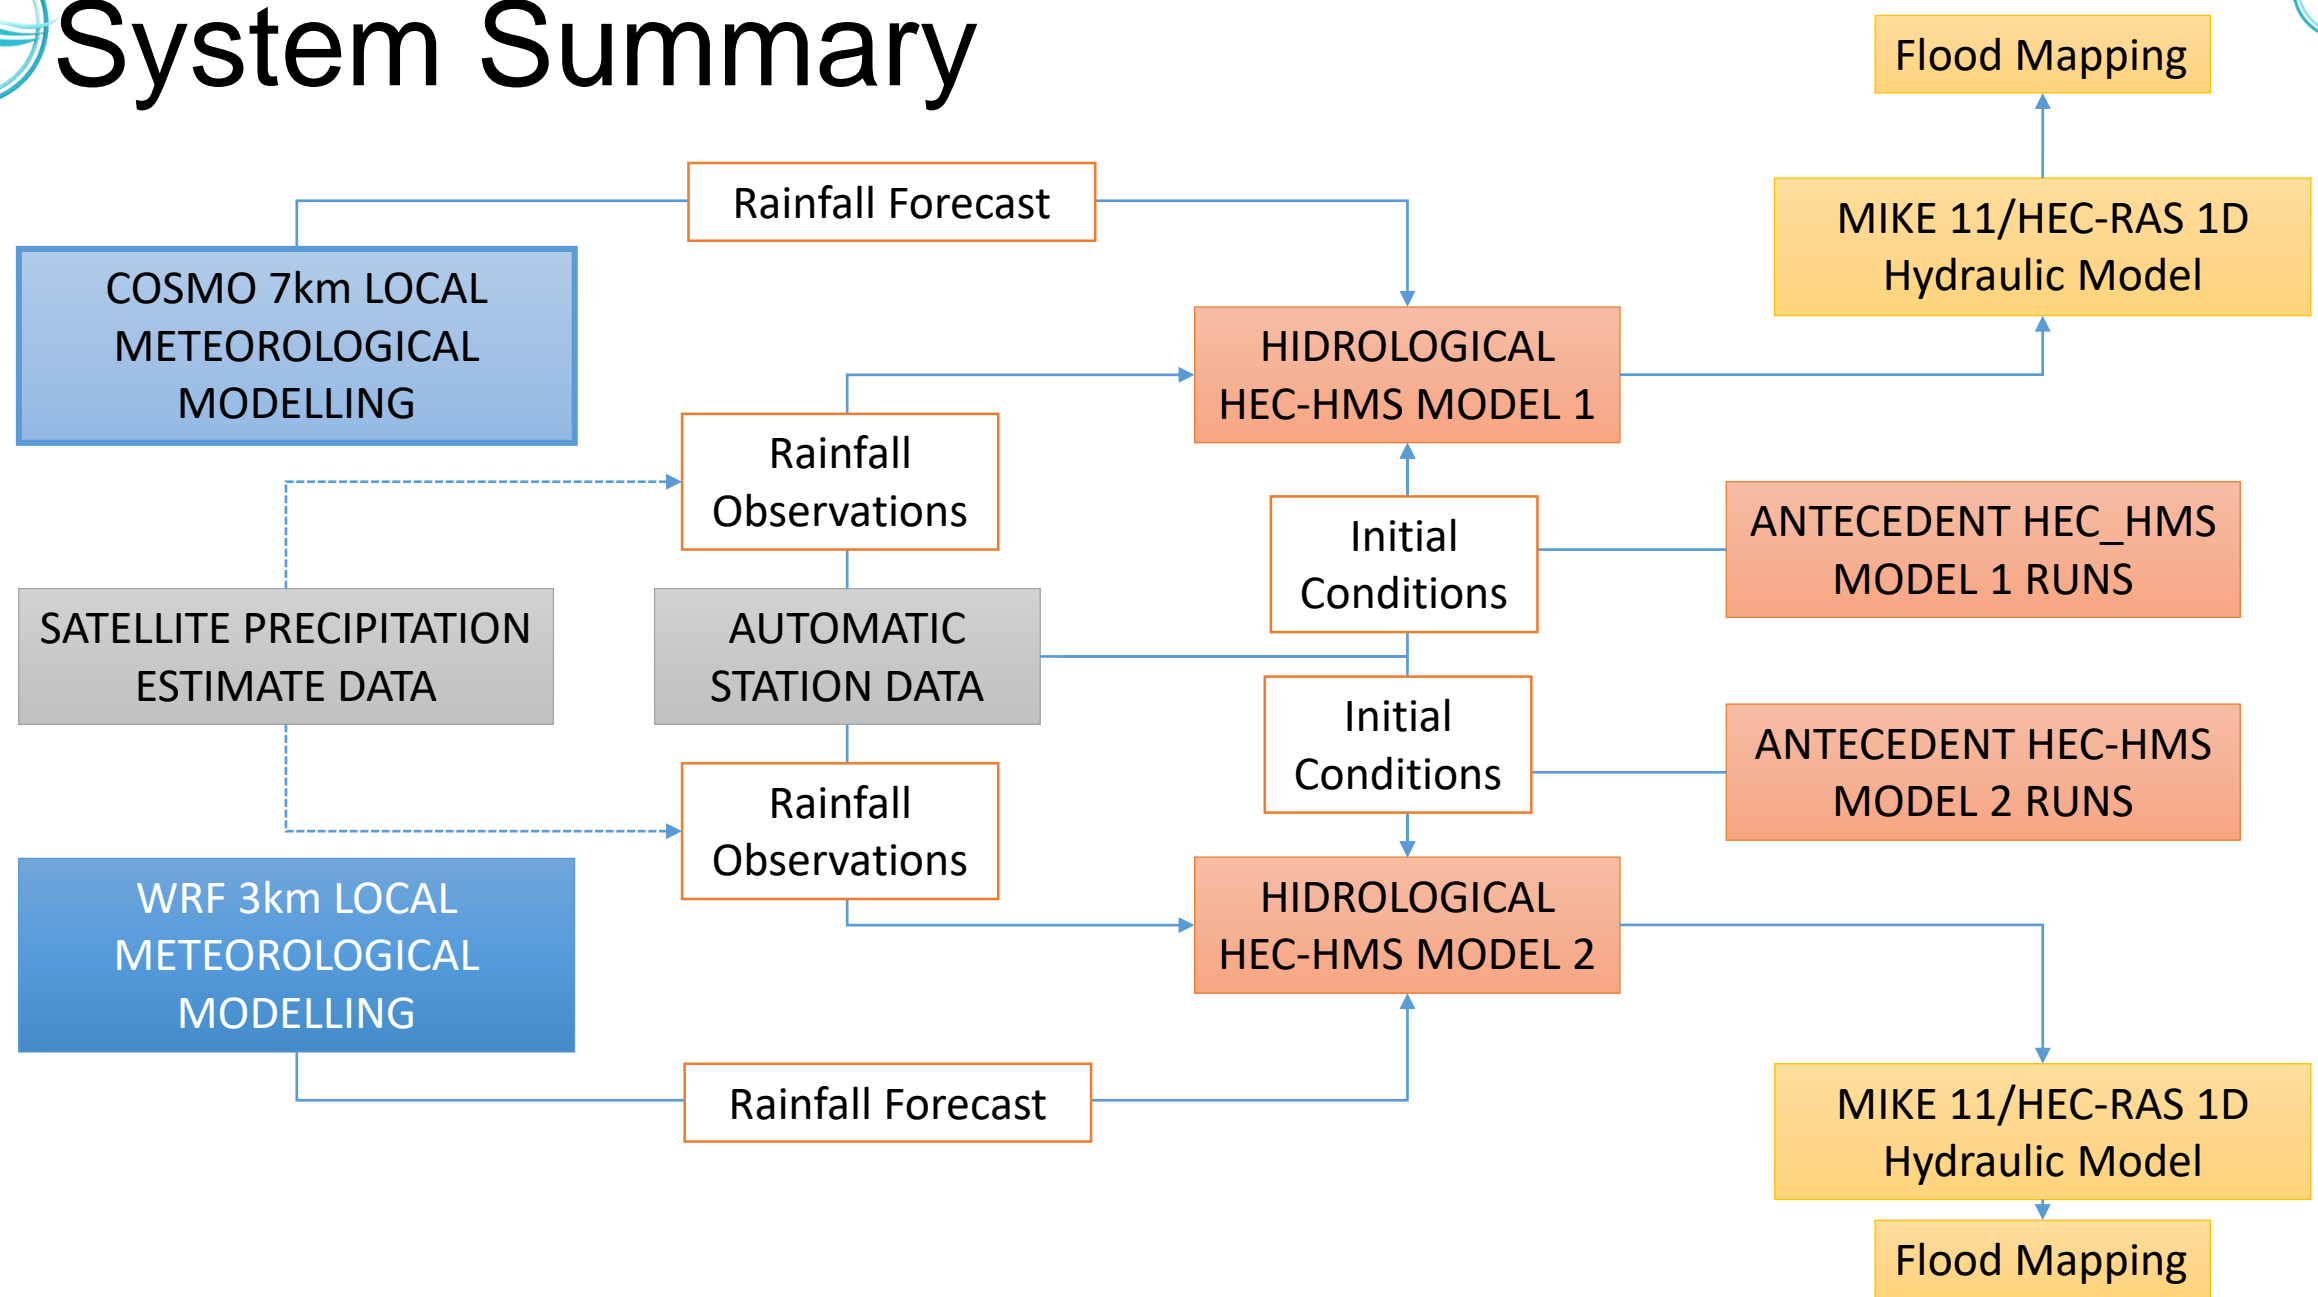

Hydrodynamic model

- MIKE 11 is the hydrodynamic model within the platform (HEC-RAS 1D models will be adopted soon)
- Model adaptor in delft-fews
- Water level information from telemetry being used for initial conditions
- Water levels calculated at specified locations

System Summary

Upgrade of HEC-HMS Model

Simulation period: 1985-1988

Data used in HEC-HMS

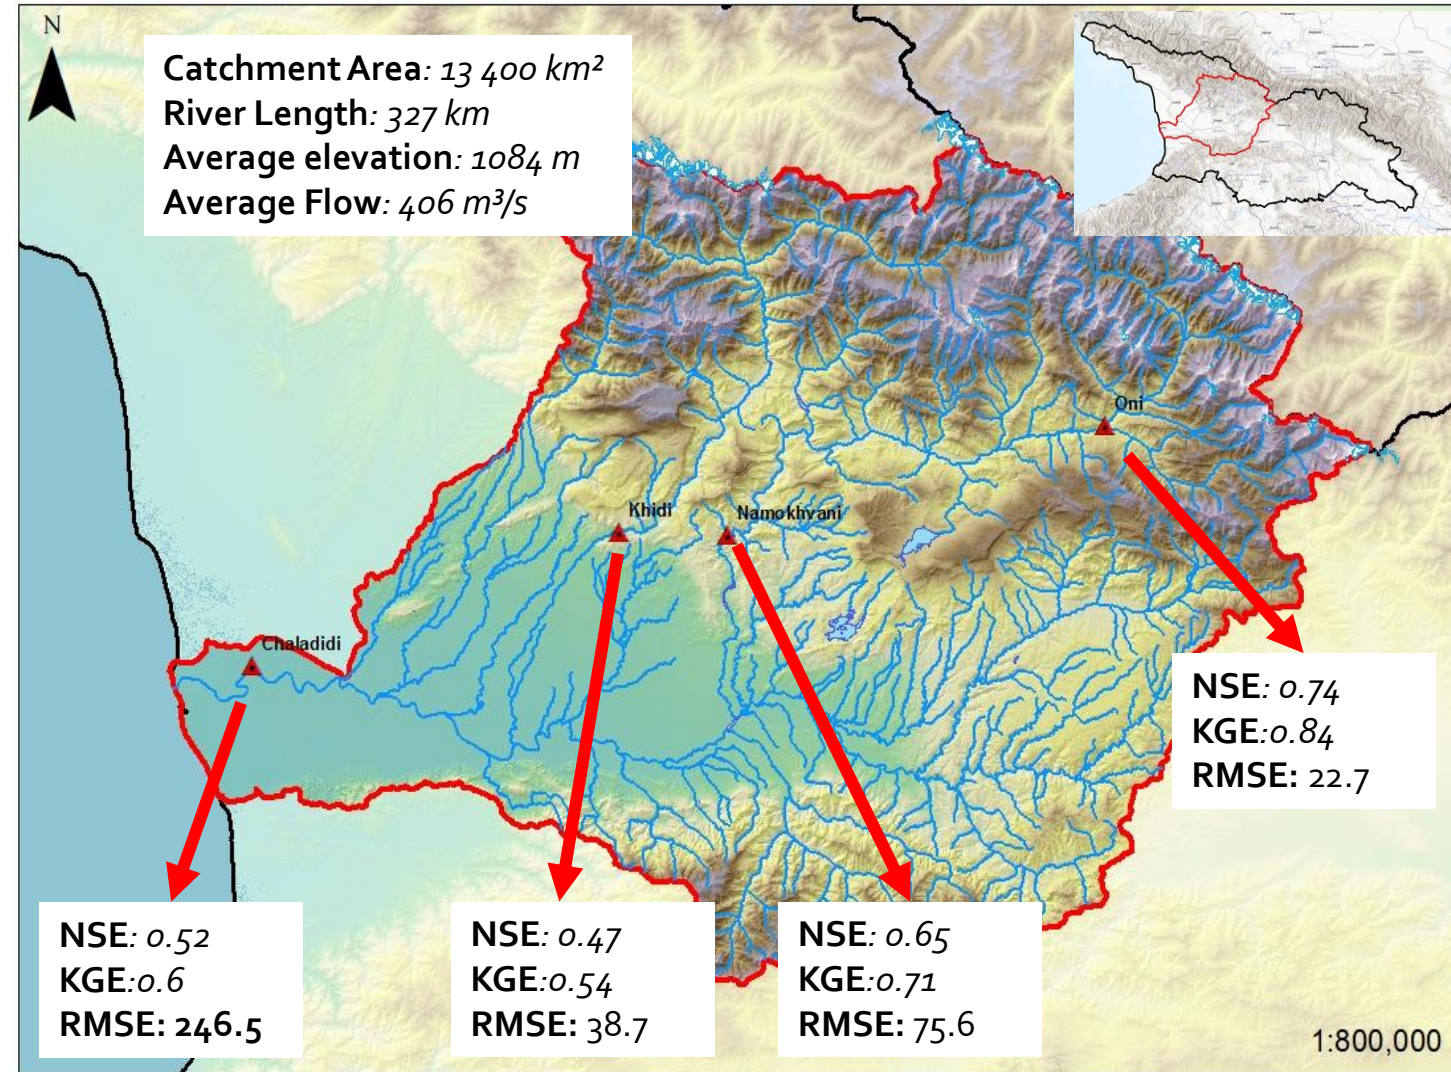

Precipitation & Temperature:

ERA5 hourly gridded data

Discharge:

Observations daily flow

Annual Peak Flows - 1978-2013

- **Lack of the data (e.g. no recent sub-daily) for the calibration & validation of models**
 - *Recently available sub-daily data*
 - *Unreliable rating curves*
 - *No sufficient flow measurements due to the human resources*
- **Lack of the experience in hydrological and hydraulic modelling**
- **Limited number of modellers**

Thank you for your attention!
